

Conclusions and future directions

Jakub Soukup, PhD

- Methodology was set for working with exosomes on neuroblastoma cells (easy, cheap, and fast)
- Infection model in primary cells and exosome isolation is set (more physiologically relevant model)
- Observed differences in exosomes from infected and uninfected cells
 - We will set up a large data collection for quantification
- We are currently working on prion fibril detection with antibodies
- Collection of data for a structure analysis
